Balbix®

Breach Risk Minimization for Under-Resourced Teams

DATA SHEET

CHALLENGES

CISOs with under-resourced security teams face many challenges:

- ***Explosion of the enterprise attack surface**: Remote employees, unmanaged devices, and applications growing rapidly.*
- ***Risk extends far beyond unpatched CVEs:** Vulnerability management only covers patching and misconfiguration and overlooks risk from identity, encryption, phishing, ransomware, password hygiene and more.*
- ***Lack of resources:** Breach risk reduction is difficult and effort is wasted on issues that aren't risky to your enterprise.*

AI and automation are key to overcoming these challenges and to make you 10x more productive by using a risk-based approach, especially if you are an under-resourced team.

SOLUTION

Balbix uses specialized AI algorithms to discover and analyze your enterprise attack surface to give a 100x *more* accurate view of breach risk, **without increasing the size of your team or your budget.**

Balbix also provides a prioritized set of actions that to reduce your breach risk by 95% or more.

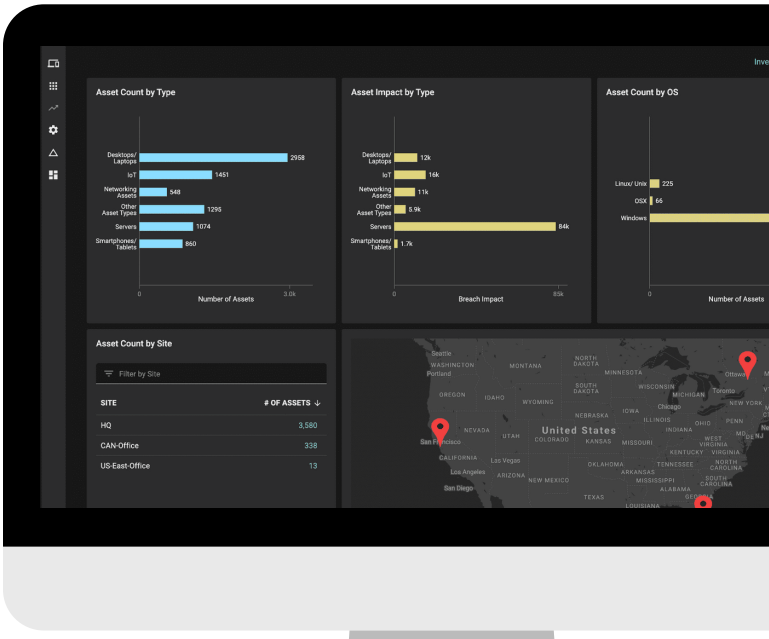
- Easy-to-deploy sensors and connectors discover and monitor all devices, apps, and users across 100+ attack vectors.
- This data is analyzed using specialized AI to predict likely breach scenarios and provide prioritized actions.
- Simple to operationalize workflows and custom dashboards enable you to optimize security posture.
- **Saves ~4 FTE equivalent/year***

FEATURES

Automated Attack Surface Discovery

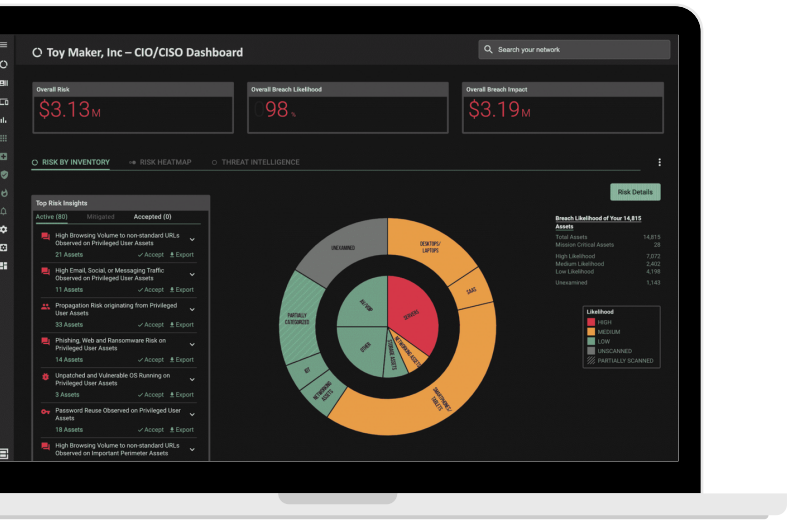
All managed and unmanaged assets including devices, apps, and services are discovered and catalogued into a centralized dashboard.

- Continuous and real-time inventory of assets
- In-depth details (software versions, open ports, running services etc.) on each asset
- Automatic categorization into perimeter, core, BYOD, infrastructure and more
- Measurement of business criticality per asset
- Saves ~1 FTE equivalent/year*



*For a 1,000 - 2,500 employee organization

Breach Risk Minimization



Your attack surface is continuously monitored for risk across 100+ attack vectors, and prioritized insights for risk minimization are provided.

- Focus on *all* vulnerabilities like encryption, password issues, phishing, ransomware etc. and not just unpatched software CVEs
- Risk based prioritization of action items
- Google-like search to get answers to questions about inventory or breach risk
- Ticketing of mitigation actions to risk owners
- Ability to define risk areas relevant to your business and track them
- Saves ~2 FTE equivalent/year*

CISO Dashboards and Tools

Custom dashboards, workflows, notifications, and reporting to keep track of your risk, all aligned to your business.

- Financial risk quantification, controls effectiveness, and decision support metrics
- Daily and weekly digests to provide stakeholders with timely data about cybersecurity posture
- Ability to create risk hierarchy ownership dashboards like CISO's high level organizational risk or BU owners more granular, technical metrics
- Saves ~1 FTE equivalent/year*
